A company wants to track their customers' orders.

Customers can give a bunch of orders.
Each order has a date, order number, a number of products with with
different amounts.

Each products's price is also required to be able to set seperately,
and different products
have different VAT percentages.

Create the required system for the products, orders and customers.

View customer's orders and order details, and the total amount due

Classes:

Customer
Order (date, id, orderItems)
OrderItem(Product, amount)
Product(name, price, tax)
